## Question 3

Here is a function to compute the third largest value in a list of **distinct integers**. All the integers are guaranteed to be positive. You have to fill in the missing lines. You can assume that there are at least three numbers in the list.

```
def thirdmax(l):
    (mymax,mysecondmax,mythirdmax) = (0,0,0)
    for i in range(len(l)):
        # Your code below this line

    # Your code above this line
    return(mythirdmax)
```

Open up the code submission box below and fill in the gap in the code. Ensure that you maintain correct indentation.

### Sample Test Cases

	Input	Output
Test Case 1	thirdmax([10,20,30,40])	20
Test Case 2	thirdmax([10,1,8,2,0])	2
Test Case 3	thirdmax([13,12,2,17,3,6,8,5,18,16,22])	17
Test Case 4	thirdmax([3,1,2])	1
